Cliff Stability and Extension (in a Conservation Area and National Park)

Historical Information

The Cliff Stability and extension are described in Document 'Proposed Works Behind Galley Doc01 2021'

Pictures of cliff failure are attached:

'Tree unearthed slipped into Tea Hut'

'Failing Gabions'

The necessity for an extension to the existing Tea Hut is detailed in:

'Proposed Works Behind Galley Doc01 2021' & plan '3029-3a Proposed Plan'

Design principle: The materials and design have been chosen to blend in with the existing structure. The whole area will be replanted upon completion, as detailed in Document 'Replanting Scheme after Stabilisation'

Environmental Impact:

There is no adverse impact and the stabilisation will secure the future stability of the cliff above the Quarterdeck

Access This is by the existing door repositioned, as per drawings.

Report from Design Engineers

I have now completed the slope stability analysis of the existing slope geometry and that of the proposed 3.00m cut from the front of the exiting gabions. This has been accomplished by using LimitState Geo software. I have used the information supplied by the topographical survey to construct the worst case slope geometry for inclusion within the computational analysis.

The ground and groundwater conditions have been derived from published geological data and from the information you have supplied to us. The published geology indicates that the cliff comprises cohesive glacial deposits. The photographs taken during the construction of the existing gabion basket wall shows the exposed almost vertical cut face of the glacial deposits to remain stable and to comprise clay with sand and gravel inclusions. No groundwater is noted in the photographs. Therefore, a very stiff clay with granular inclusions has been adopted for this assessment and design. It is noted that the Quarter Deck has been constructed on imported engineered fill placed at the toe of the original cliff.

The new cut profile accommodates the additional 3.00m that you require for stage at the rear of the existing Tea Hut. I have also designed the proposed slope stability measures to be independent of the Tea Hut structure. This is so that the slope can be stabilised prior to the construction of the new extension.

The newly profiled embankment is modelled at a nominal 10 degrees from the vertical. Steel netting with erosion protection is held in place by a series of 5.00m long and 2.00m long duck bill anchors as shown on the attached sketch section. The netting will also need to be supported by a steel cable secured at the top of the slope and at the toe. It is envisaged that additional steel cables will be required on the slope to contour the netting.

Prior to the construction of the newly profiled slope, vegetation and loose materials will need to be removed. The construction of the newly profiled and secured slope will need to be undertaken in bays and by adopting a ‘top down’ technique. This is where the netting and anchors are installed, starting at the top and prior to excavating the new slope profile just below it. The steel netting can then be rolled down over the newly profiled ground surface to the next area to be excavated below. This can then be repeated until the netting and anchors have been installed at the base of the slope. Then the next bay can be treated in a similar manner.

It is noted that the existing gabion baskets have been filled with what appears to be 7 newton blocks and faced with sandstone. The sandstone can be retained to provide a facing to the bottom of the slope. The slope will be free draining.

The computational analysis of the proposed new slope has resulted in an adequacy of 117.7 for loads and 1.251 for strengths. These are the factors by which loads will need to be increased to cause failure or for strengths to be decreased to cause failure. Failure is considered to occur at an adequacy of 1 or below.

Proposed Works Behind the Galley on The Quarterdeck

Principally, this planning application has been made necessary by the increasing instability of the cliff behind the Galley on the Quarterdeck, but in doing so, provided an opportunity to create much-needed additional storage and preparation space.

Since its original conception in 2019, no one could have forecast the Galley's massive popularity, serving a large variety of quality food and drink close to the beach; so much so, The Galley now plays a vital role in attracting tourism and providing refreshments in the area..... See Trip Advisor's 5* reviews:

[https://www.tripadvisor.co.uk/Restaurant Review-g504012-d16929160-Reviews-The Galley on the Quarterdeck-Robin Hoods Bay North York Moors National Park Nor.html](https://www.tripadvisor.co.uk/Restaurant_Review-g504012-d16929160-Reviews-The_Galley_on_the_Quarterdeck-Robin_Hoods_Bay_North_York_Moors_National_Park_Nor.html)

The extension to the rear of the Galley will enable us to provide more local employment, all of whom presently live locally and walk to work.

This is an incredibly expensive stabilisation project, but necessary to ensure the future of The Galley on the Quarterdeck; ultimately improving, protecting and stabilising this much visited part of Robin Hoods Bay and all private funded.

The steps onto the Quarterdeck, from Covet Hill, have always been busy; we have a digital counter across them, which clocked an incredible 4,200 people on the single busiest day this year.

The movement of the cliff has been accelerated by excessive rainfall over the past 2 years and this is not an isolated case. Boggle Hole experienced similar problems, where the land to the North of their main building totally collapsed, causing them to close for several months. The same designers and remedial engineers have been employed to produce a scheme to rectify and stabilise the land above the Quarterdeck.

When the Quarterdeck was first built, in the 1950's, the clay was simply graded back. However, movement must have occurred, up to the year 2000 and a scheme of land drains were installed (See Drawing 'Quarterdeck Land Drainage062') Precipitation and drainage were key design points for a

successful scheme, preventing future movement of the cliff. Unfortunately, the land drains have become increasing ineffective and the clay has become waterlogged, resulting in movement of the slippery clay, which in turn sheared the land drains.

We will, no doubt expose, the original land drains and attempt to de-silt and reconnect, where they have sheared. The surface water from the Tea Hut and proposed extension will also be connected to them; this will help prevent future silting by maintaining a flow of clean rainwater.

In 2019 the Gabions were designed and built in front of, what was at that time, fairly solid clay and shale rock partials, see picture ‘Fully self supporting clay behind gabions 2019’ ; unfortunately, due to the unprecedented rainfall, the weight of the clay has pushed the gabions so far forward they are becoming unstable and about to touch the back of the tea hut.

In June of 2021 a contractor was employed to move some of the excessive and uneven weight of clay to the left side, making the angle of the slope more uniform. This was reasonably successful, but the gabions continued to move and tilt further forwards.

The engineers propose a scheme of stainless-steel netting, starting immediately below the existing cliff path and work down. They are held in position by a huge quantity of 5m long stainless-steel duck bill anchor plates, pushed into the slope, reduced to 2m long at Quarterdeck ground level. The retaining stainless steel mesh, which is clamped to them, will finish at Quarterdeck level; this is where the new storage and prep area will fit neatly behind the existing tea hut. The roof will continue its popular wave design, to cover over the new extension and the existing stone filled Gabions will be reinstalled to form a cosmetic front face

Replanting Scheme after Stabilisation

NYMNPA

13/12/2021

Advice was sought on how to reinstate the foliage after work is completed. The designing engineer responded to my enquiries below. However, we can encourage quicker growth by spreading native seeds over the area and planting shrubs like Sea Buckthorn around the edges of the retaining mesh. The consensus of opinion is, tall trees on an exposed coast, make stabilisation worse, when high winds rock the roots; high density low shrubs, with a vigorous rooting system retains the surface much better.

Using trees and plants is an effective way of reducing the effects of surface water erosion and weathering (solifluction). However, in this instance, we are using a combination of soil nails to reduce deep seated circular and shallow translational failure mechanisms along with active steel netting in combination with erosion protective matting. The steel netting will actively support the soils within the slope as the slope angle (from the horizontal) is steeper than the effective angle of internal friction of the insitu glacial soils in the slope. The erosion protection matting will sit below the active steel netting and provide some protection against surface water run-off and weathering.

Over time, soil particles will get entrapped within the erosion protection matting and will naturally seed up with native grasses and plants. This will then 'green up' over time. If it is proposed to plant trees and shrubs onto the stabilised slope, this will require holes to be cut through the active steel netting for them to be planted and for them to grow. This will degrade the effectiveness of the active steel netting and its ability to stabilise the slope. The soils nails, steel netting and erosion protection matting will provide similar stability, if not more, to that provided by the root system of trees and shrubs. However, until any planted trees and shrubs have established a significant root system within the slope, its stability will be compromised unless soil nails, steel netting and erosion protection matting has been installed.

Flowering creeping plants can be planted at the base of the stabilised slope which will then become entwined in the steel netting etc and, over time, provide a pleasing cover to the slope. It will also discourage the public from climbing the slope. very good at gardening and plant types but my colleagues who are, suggest plants such as an evergreen ivy or clematis.

This report was generated by LimitState:GEO3.5.g.24265 - limitstate.com

About this Report

This report has been generated using LimitState:GEO, a software application capable of directly identifying the critical collapse mechanism for a wide variety of geotechnical stability problems, including those involving slopes, retaining walls, footings etc.

The software utilizes the Discontinuity Layout Optimization (DLO) procedure to obtain a solution (Smith and Gilbert 2007). The main steps involved are: (i) distribution of nodes across the problem domain; (ii) connection of every node to every other node with potential discontinuities (e.g. slip-lines); (iii) application of rigorous optimization techniques to identify the critical subset of potential discontinuities, and hence also the critical failure mechanism and margin of safety.

The accuracy of the DLO solution is controlled by the specified nodal density. Within the set of all possible discontinuities linking pairs of nodes, all potential translational failure mechanisms are considered, whether anticipated or not by the engineer. Failure mechanisms involving rotations along the edges of solid bodies in the problem can also be identified. Thus in this case the solution identified by the DLO procedure is guaranteed to be the most critical solution for the problem posed. This means that there is no need to prescribe any aspect of the collapse mechanism prior to an analysis, or to separately consider different failure modes. The critical mechanism and collapse load factor are determined according to the well established upper bound theorem of plasticity.

LimitState:GEO reports the solution to a problem both visually as a collapse mechanism and numerically in terms of an Adequacy Factor, which is defined as the factor by which specified loads must be increased, or material strengths decreased, in order for the system under consideration to reach a collapse state.

Heritage Statement for Cliff Stability & Extension

The Galley on the Quarterdeck

Robin Hoods Bay

NYMNPA

21/12/2021

Overall Existing character and appearance of the Quarterdeck and proposed Tea Hut

In accordance with planning policy HE6 of PPS5 which sets out to assess the overall impact of the proposed extension and cliff stability project of the Tea Hut on the Heritage Asset and evaluate the measures taken to ensure that the proposals do actually contribute to the asset, I have prepared the following statement.

Having examined this part of the conservation area of Robin Hoods Bay, the general character and appearance is that of mixed architectural styles of houses and cottages ranging from 17th century to Victorian. There are varied and mixed use of different materials from painted render to traditional lime mortar and natural sand stone, with some uninspiring alterations and additions from the 1960's era.

The proposal is primarily for a stabilisation project of the cliff, which has become increasingly mobile due to excessive rainfall, over the past 2 winter seasons. The works involved will create a space to insert a storage extension to the existing Tea Hut, names The Galley on the Quarterdeck; it is set in a conservation area of the North Yorkshire Moors National Parks.

Assessment of Impact:

The proposal is again set on the cliff side, which was once all clay and no vegetation, as can be seen in the original photograph. The concrete sea defences, built in the mid 1950's, are in a style completely different to the main Heritage Asset and are clearly punctuated from the Heritage Asset by the galvanised steps leading from the Heritage Asset, down onto the concrete sea wall and viewing area. The area behind the new concrete sea defences is mostly low-level vegetation, designed to stabilise the soil with its extensive root formation. After the stabilisation works are completed, the vegetation removed will be replanted and seeded. Very little will be seen of the extension, apart from its dark grey wave design roof, which will be a continuation of the existing Tea Hut. Therefore, there is no negative impact of the proposal on the Heritage Asset itself, nor the surrounding conservation area of the National Park.

Mitigation Strategy:

Because there is a very clear demarcation line between the Heritage Asset and the modern, but highly necessary concrete sea defences, we feel the style of the proposal is sympathetic to the Heritage Asset in a number of ways:

- 1) The existing natural stone-faced Gabions will be replaced, when the works are completed.
- 2) .
- 3) The exposed parts of the extension will be in natural stone, which will age and blend in with the existing vegetation and surroundings
- 4) The continuation of a curved style of roof is a seamless blend of the modern Quarterdeck and the Heritage Asset.
